Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	2 Marks

Customer Problem Statement:

The existing metro ticket booking process often lacks a centralized platform to manage passenger registration, station information, ticket booking, and fare management in a single system. This can lead to inconsistent data handling, increased administrative effort, and difficulty in tracking passenger bookings and ticket records.

The proposed **Metro Ticket Booking System** is designed as a ServiceNow application that automates the complete metro ticket booking lifecycle. The system allows passengers to register, select source and destination stations, calculates the ticket fare automatically based on the travel route, and generates a digital ticket with a unique QR code after successful booking.

The application maintains all passenger, station, and booking information in a centralized database, enabling efficient ticket management, easy record tracking, and improved operational control. Automated workflows and notifications reduce manual work while providing passengers with a fast, secure, and convenient booking experience. This solution improves service efficiency, enhances data accuracy, and supports a scalable digital ticketing system for metro transportation.
